

Hoe bepalen we (a, b, c) ?

vlak $ax + by + cz = 1$

verschuiven
zodat

$A \leftarrow (0, 0, 0)$

$$\begin{cases} x = x + x_A \\ y = y + y_A \\ z = z + z_A \end{cases}$$

vlak $a(x + x_A) + b(y + y_A) + c(z + z_A) = 1$

$ax + by + cz = 0$

$\Rightarrow$ Vector $(a, b, c) \perp$ wil vector in vlak
 $ax + by + cz = 0$

(want scalar produkt = 0)

Conclusie: Vector $(a, b, c) \perp$ vlak dat $\triangle ABC$ bevat.
